Deploy App on external web server

You can create stand-alone web application application in spring boot that can be executed in-build tomcat.

You can also create WAR of spring boot application and deploy it on external J2EE web server like JBoss, Tomcat, Jetty etc.

In order to deploy application on external server you need to extend your startup class by *SpringBootServletInitializer*.

```
public class MyApp extends SpringBootServletInitializer {
        public static void main(String[] args) {
                SpringApplication.run(MyApp.class, args);
        }
}
```

In order to create WAR file you have to change packing setting to WAR in POM.xml file.

```
<packaging>war</packaging>
```

Now Simple we need to Click on Our Application Right click >Run As> Maven Build > then It will open a window of Edit Configuration and Launch > in the Goal text type "clean package" then click on run button.

At console you will see progress for build creation started.
